

No.11 DRA Member Briefing Note

MCSI & Handicap System for F-Class Disciplines

Dear Members,

Following a request from members at the October 2025 AGM, the No.11 DRA has implemented the MCSI-14 scoring and handicap system for F-Class disciplines to provide a more consistent method of comparing performances between F-Class Standard (FS), F-Class Open (FO) and F/TR competitors.

The system uses the recognised **MCSI-14 10-shot lookup table**. Under this system, a shooter's raw score and centre count are first combined to create a lookup score.

For example:

- 60.10 = 70 lookup score
- 58.6 = 64 lookup score

The lookup score is then matched against the appropriate discipline column within the MCSI-14 table to determine the shooter's MCSI value. Each discipline has its own lookup column, meaning the same raw score may produce slightly different MCSI values depending on whether the shooter is competing in FS, FO or F/TR.

Discipline	Raw Score	Centres	Lookup Score	MCSI-14
F-Class Standard	60	10	70	100.0
F-Class Standard	58	6	64	91.4
F-Class Open	60	10	70	99.6
F-Class Open	58	6	64	87.2
F/TR	60	10	70	99.8
F/TR	58	6	64	89.5

These values are taken directly from the recognised MCSI-14 lookup table and are not manually adjusted.

Handicap System

The handicap system operates separately from the MCSI lookup table. A shooter's handicap is calculated by comparing their historical average MCSI score against a benchmark target score of 190 points.

The 190-point benchmark was selected because it broadly represents a strong combined two-range performance across the F-Class disciplines under the MCSI-14 system. It provides a common reference point from which handicaps can be calculated consistently across all disciplines.

Shooters averaging below 190 receive a handicap allowance based on the gap between their average and the benchmark score, while shooters averaging close to or above 190 receive little or no

handicap assistance. The intention is not to equalise disciplines, but rather to reward improvement and maintain competitiveness throughout the field.

Formula:

$$\text{Handicap} = (190 - \text{Average MCSI}) \times 0.70$$

The resulting handicap is then added to the shooter's current competition MCSI total to produce the Handicap Adjusted Score.

The No.11 DRA will continue to monitor the operation of the system and review feedback from members as further competition data becomes available.
